

CORSO SUPERIORE SIFO IN FARMACIA CLINICA Ed. 2015-2016 – II ANNO

Catania, 27 - 30 settembre 2016

I RADIOFARMACI

RUOLO DEL FARMACISTA IN MEDICINA NUCLEARE

Maria Concetta Fornito

U.O.C. Medicina Nucleare

P.O. Nesima A.R.N.A.S. GARIBALDI

LA MEDICINA NUCLEARE

- CHE ROBA È ...
- A COSA SERVE ...
- FA MALE ...

CHE COSA E'?

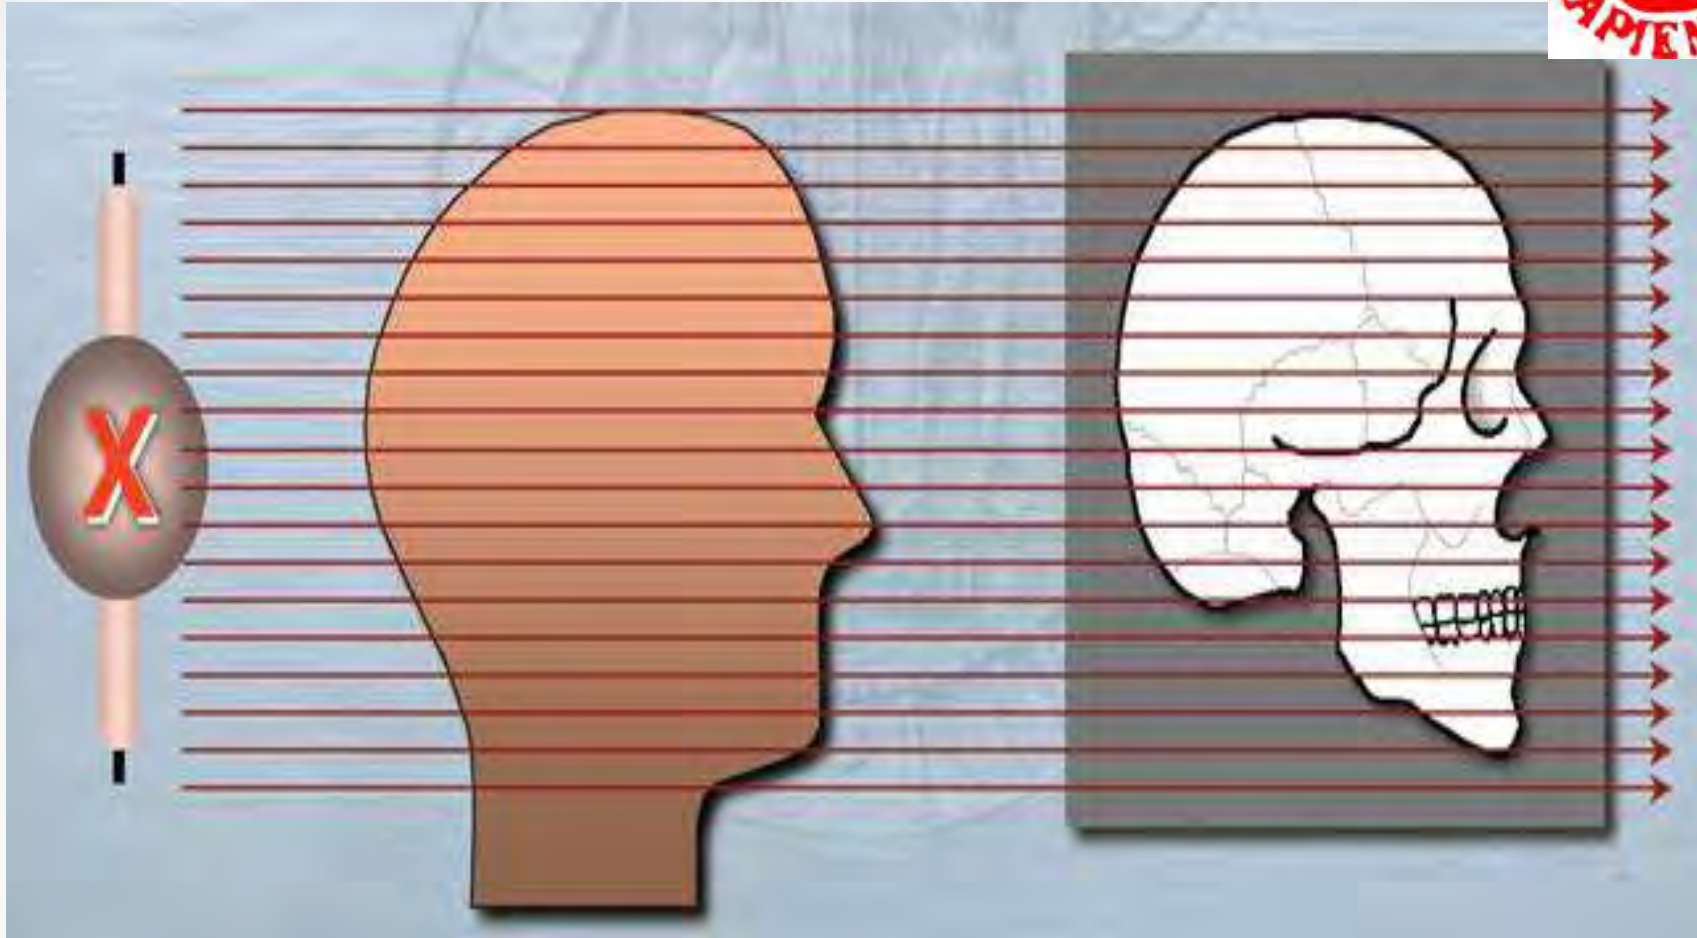

E' LA BRANCA SPECIALISTICA DELLA MEDICINA CHE SI AVVALE DELL'USO DI RADIONUCLIDI A SCOPO DIAGNOSTICO, TERAPEUTICO E DI RICERCA BIOMEDICA.

PERMETTE L'INDAGINE "IN VIVO" DEI PROCESSI BIOLOGICI, FISIOLGICI E PATOLOGICI.

I RADIOISOTOPI, CONIUGATI A MOLECOLE O CELLULE CHE FUNGONO DA VETTORI E LI RENDONO "**INTELLIGENTI**", VENGONO INTRODOTTI NELL'ORGANISMO E PERMETTONO DI IDENTIFICARE ORGANI E TESSUTI SANI E MALATI E, IN ALCUNI CASI, DI IRRADIARE I TESSUTI PATOLOGICI

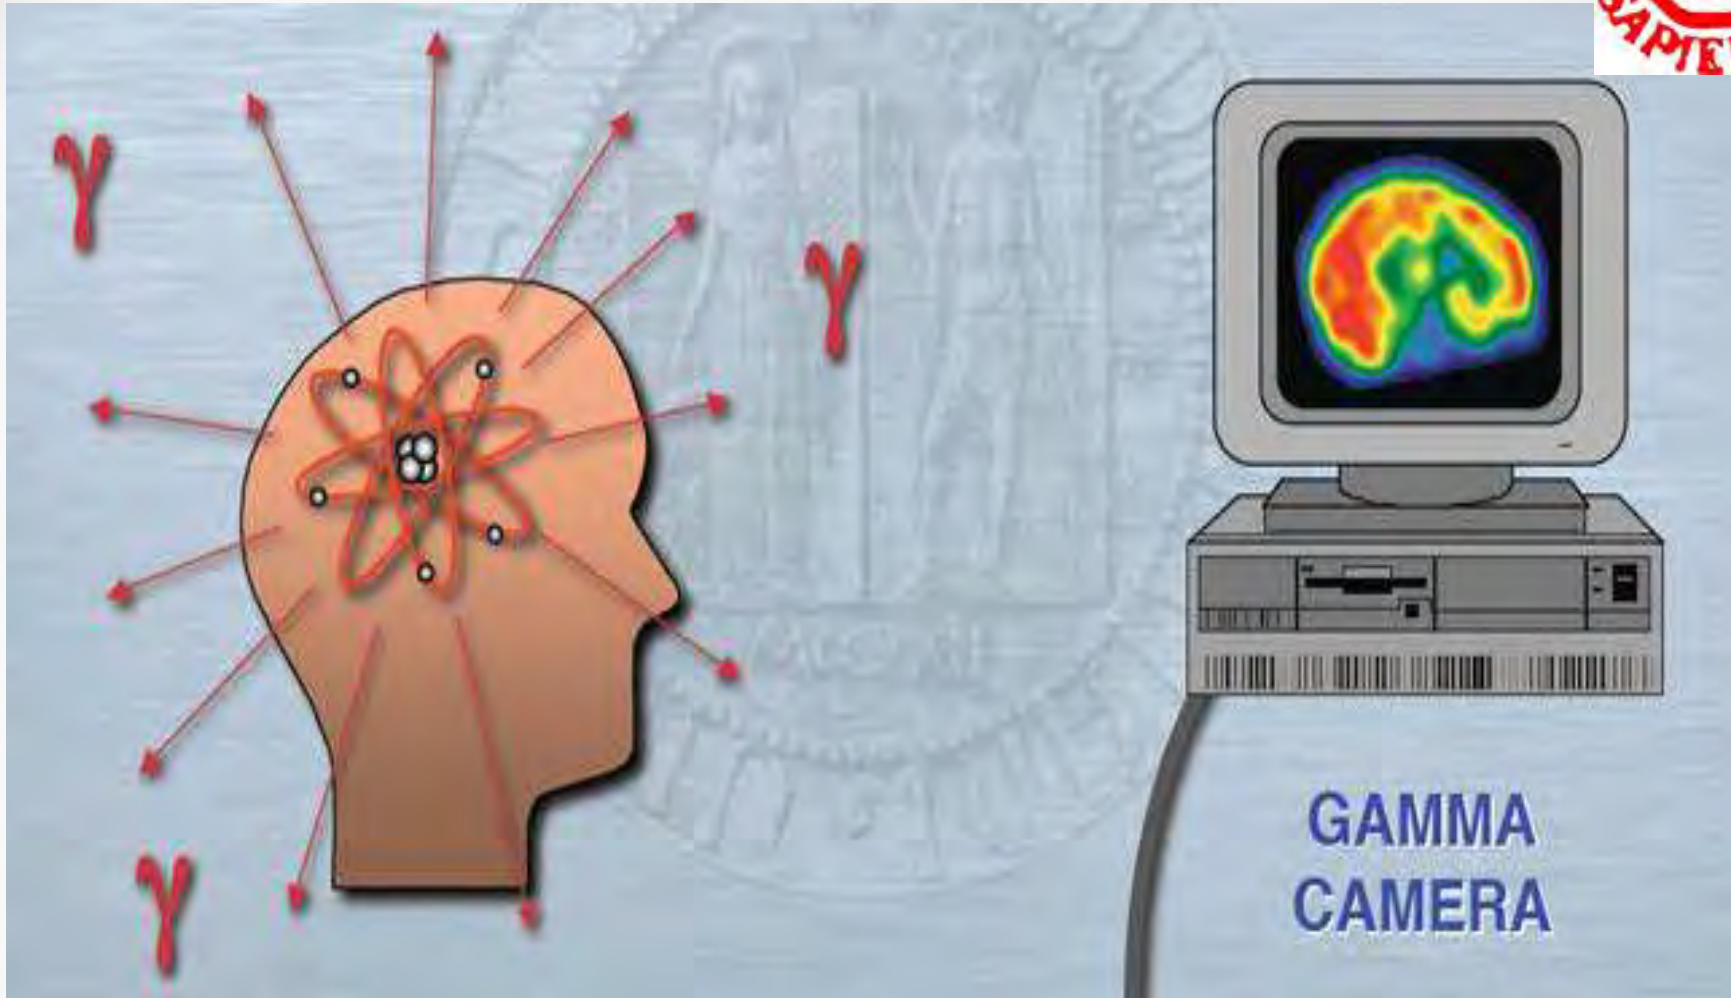

IMMAGINI RADIOLOGICHE

Il fascio di radiazioni X provenienti da un tubo radiogeno viene attenuato dai tessuti interposti da analizzare prima di raggiungere il sistema di rilevazione

IMMAGINI MEDICO NUCLEARI

Si ottengono rilevando le radiazioni emesse dal radiofarmaco distribuito nell'organismo.

E' il paziente che emette le radiazioni

Radiologia

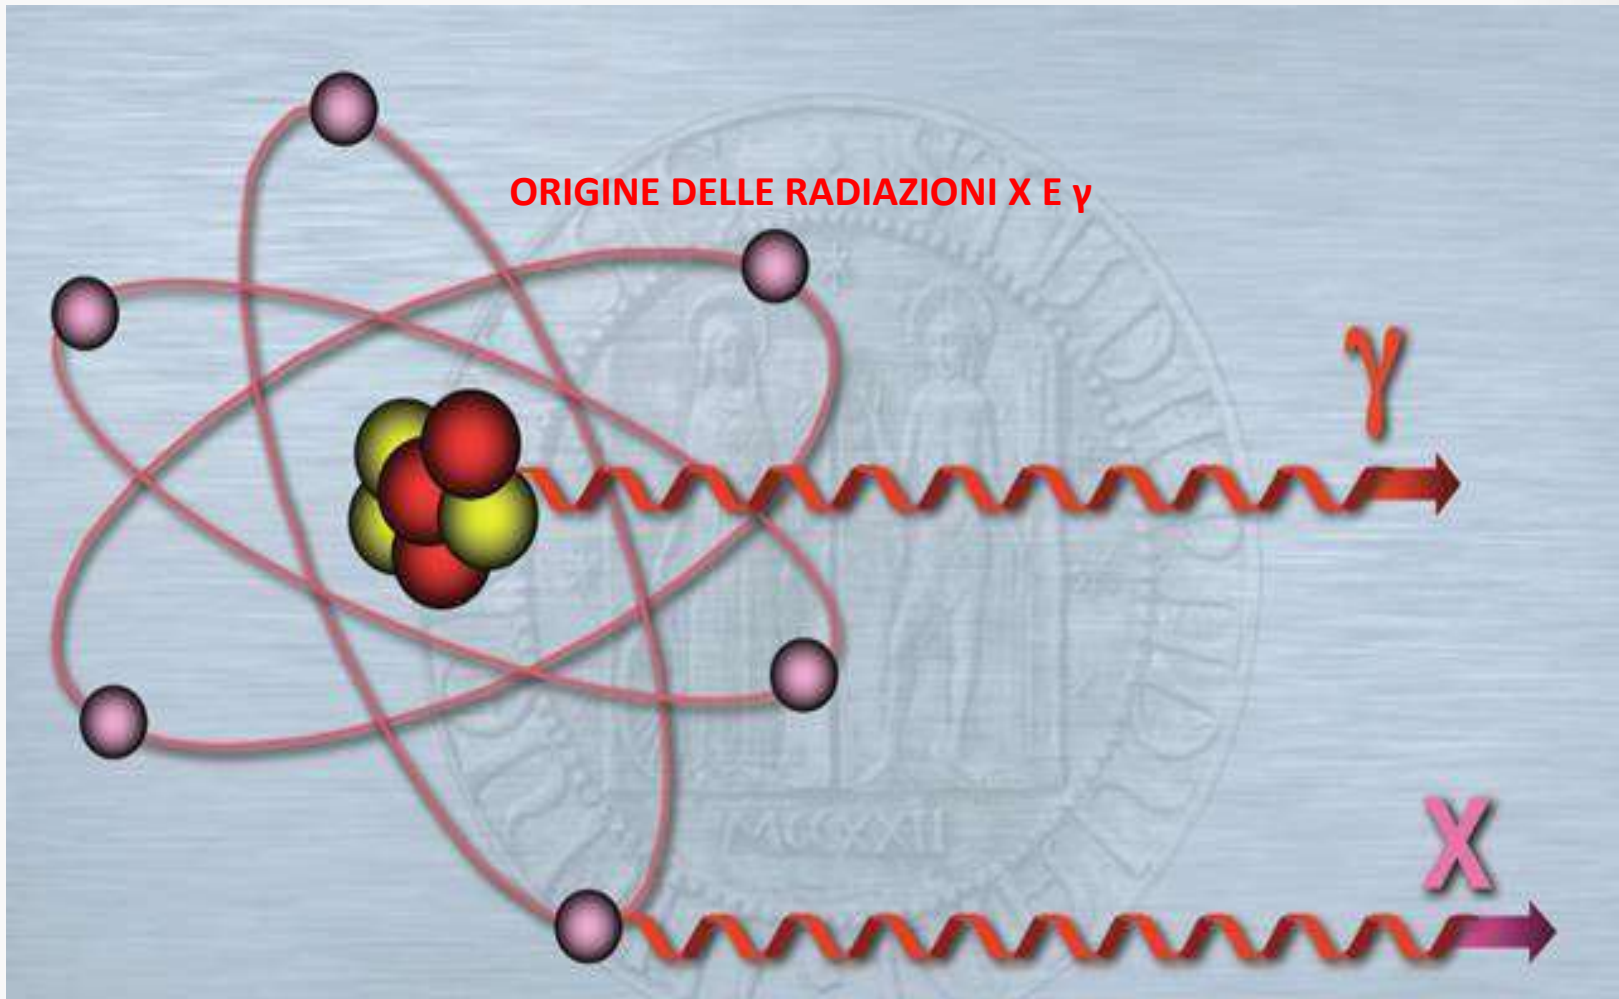

Medicina Nucleare

Nuclear Medicine Vs Radiography

LA MEDICINA NUCLEARE E' ANCORA GRAVATA DA UN ALONE DI MISTERO E DI TIMORE LEGATO SOPRATTUTTO ALL'AGGETTIVO "NUCLEARE" CHE FA RIAFFIORARE ALLA MEMORIA OLOCAUSTICI BELLICI ED INCIDENTI NUCLEARI.

NON C'E' ALCUNA DIFFERENZA, A PARITA' DI ENERGIA, TRA GLI EFFETTI DI UNA RADIAZIONE "X" RADIOLOGICA ED UNA " γ " (gamma) MEDICO NUCLEARE

RADIAZIONI E LORO POTERE DI PENETRAZIONE

A COSA SERVE?

- 
- CHE ROBA È ...
 - A COSA SERVE ...
 - FA MALE ...

- ❖ DOSAGGI DI LABORATORIO *"IN VITRO"*
- ❖ IMAGING *"IN VIVO"* MEDIANTE LE SCINTIGRAFIE

FA MALE ?

SICURAMENTE NO!

LE TECNICHE DI IMAGING MEDICO NUCLEARE NON SONO INVASIVE. IL PAZIENTE SUBISCE AL MASSIMO UNA INIEZIONE ENDOVENOSA

I RADIOFARMACI USATI SONO ASSOLUTAMENTE SICURI E PRIVI DI REAZIONI AVVERSE

LA RADIOATTIVITA' E' NORMALMENTE PRESENTE NELL'AMBIENTE

BASTI PENSARE ALLE RADIAZIONI COSMICHE O A QUELLE PRODOTTE DALLE ROCCE , ASSORBITE DURANTE VIAGGI INTERCONTINENTALI IN AEREO O DURANTE TERAPIE TERMALI.

Radiofarmaci per l'apparato osteoarticolare

Biologia dell'osso

L'osso è sempre in uno stato attivo di rimodellamento (costruzione/distruzione)

- **Riassorbimento**: gli osteoclasti stimolati erodono l'osso creando una cavità.
- **Inversione**: la superficie ossea è preparata per gli osteoblasti che iniziano a formare osso.
- **Formazione**: Gli osteoblasti sostituiscono l'osso riassorbito e riempiono le cavità con osso nuovo.
- **Riposo**: la superficie dell'osso riposa sino al nuovo ciclo di riassorbimento.

Scintigrafia Total Body

Scintigrafia Normale :

Scheletro assiale ed appendicolare, simmetria, presenza di attività nei tessuti molli, reni con minima attività, vescica, tiroide, contaminazione.

Radiofarmaci per scintigrafia ossea

- I difosfonati marcati con tecnezio-99m sono i radiofarmaci di scelta per la scintigrafia ossea
- Diffondono passivamente negli spazi extra-vascolari ed extracellulari e si depositano intorno alla matrice ossea
- La quota di radiofarmaco che non viene legata, viene eliminata dal plasma per escrezione renale
- Le immagini tardive mostrano il legame del tracciante alla matrice ossea, visualizzando l'intero apparato scheletrico
- L'esame viene eseguito 2-3 ore dopo l'iniezione per ottenere un elevato rapporto osso/fondo, che garantisce una buona qualità dell'immagine
- Maggiore è il flusso ematico e l'attività metabolica di una particolare regione ossea, maggiore sarà la concentrazione del tracciante

Radiofarmaci per scintigrafia tiroidea

Scintigrafia tiroidea

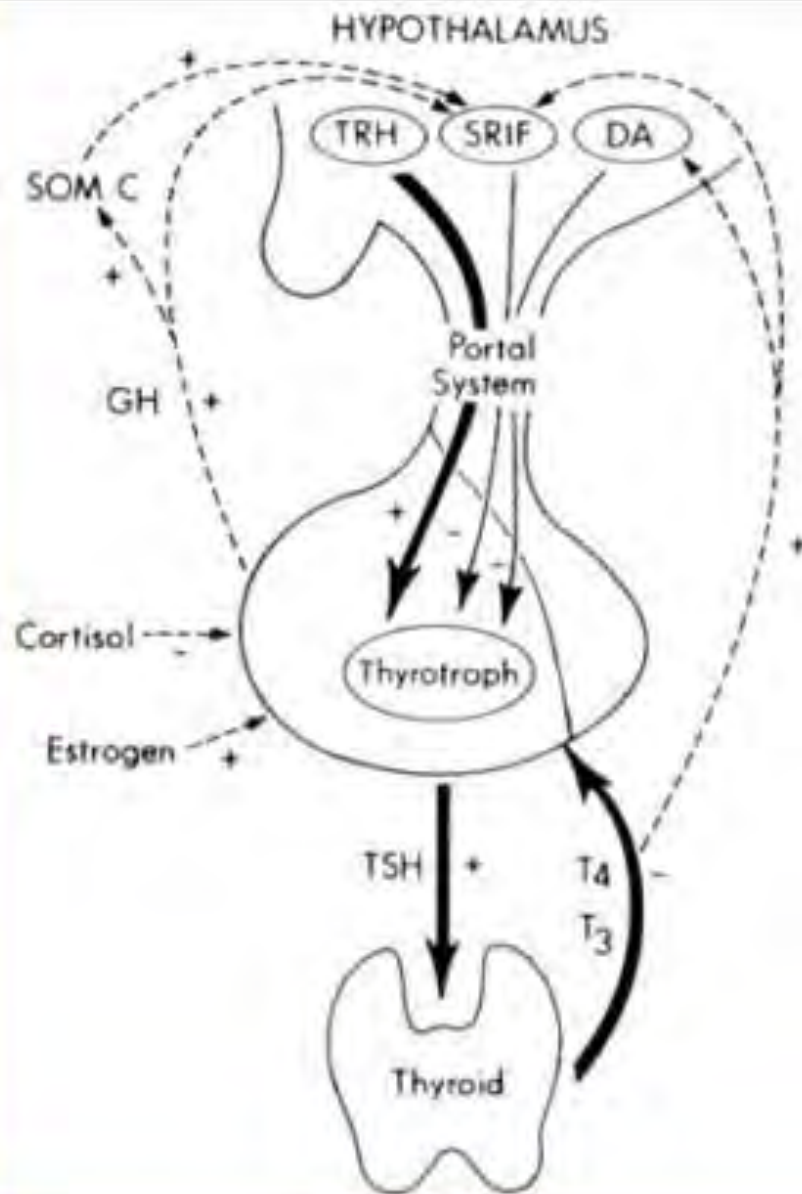

The complex block contains three main elements. At the top left, a dark blue banner contains the text 'Scintigrafia tiroidea' in white. Below this is an anatomical diagram of the human neck, showing the thyroid gland in red, the trachea in grey, and the major blood vessels (carotid and jugular) in blue. At the bottom right of the diagram is a small signature 'F. Neri' and the word 'Quintessenza'. To the right of the anatomical diagram is a thyroid scintigraphy scan, which shows a dark blue background with several bright yellow and green spots representing the uptake of the radioisotope in the thyroid gland.

Radioisotopi per lo studio della tiroide

	Emivita	KeV	MBq	Caratteristiche
Tc-99m	6 h	140	100	Facilmente disponibile Poco costoso Bassa dose al paziente
I-131	8 g	364	1.4	Relativamente alta dose
I-123	13 h	159	3.7 – 18.5	Proprietà fisiche favorevoli Costo elevato Difficilmente disponibile

Radiofarmaci per lo studio del sistema nervoso centrale

LA MALATTIA DI ALZHEIMER

Dal punto di vista neuropatologico, i cervelli dei pazienti colpiti da Alzheimer sono caratterizzati da placche costituite dall'accumulo di proteina beta-amiloide e dalla formazione di grovigli (ammassi neurofibrillari della proteina tau).

LINFONODO SENTINELLA

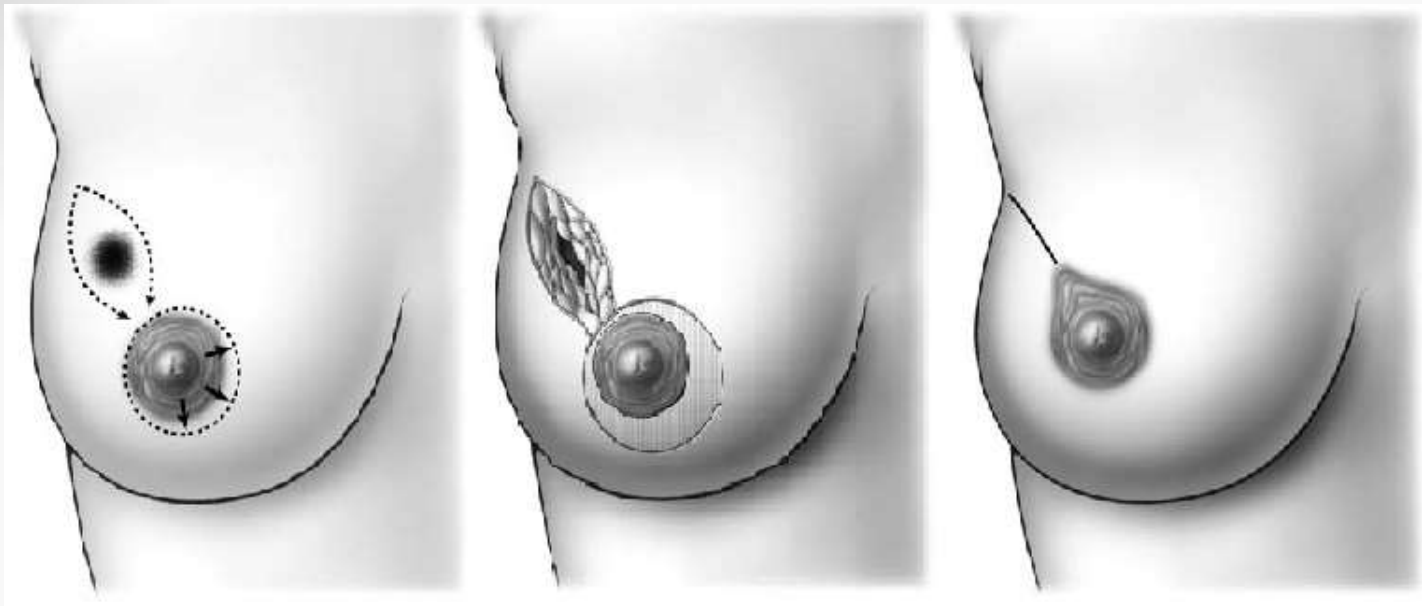

Mastectomía radical modificada

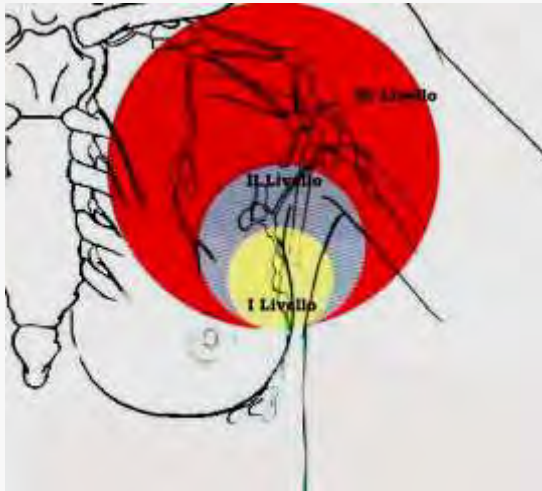

Figura 1 – Linfedema del brazo derecho (dominante)

Lymphedema in the dominant arm

La dissezione ascellare di per se non migliora la prognosi, ma è importante come elemento di stadiazione

La biopsia radioguidata del Linfonodo SENTINELLA rappresenta attualmente lo standard nella terapia del carcinoma mammario di dimensioni limitate.

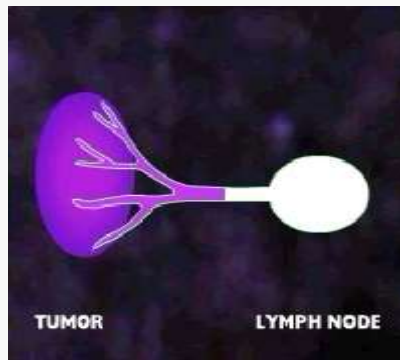

Linfoscintigrafia

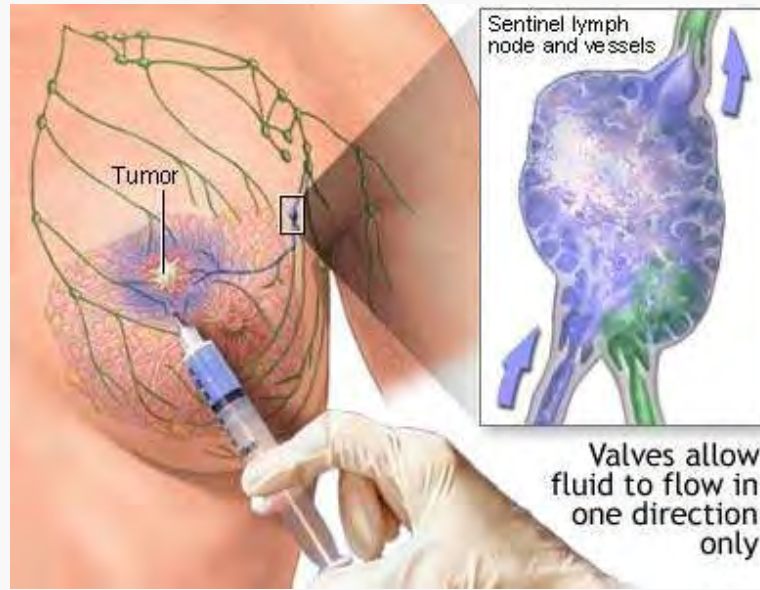

Definizione di LINFONODO SENTINELLA

- Il Linfonodo Sentinella è quello che drena dal tumore primitivo con un canale linfatico diretto ed è pertanto il primo ad essere coinvolto dallo spreading linfatico tumorale
- Possono esservi più di un Linfonodo Sentinella

Biopsia del linfonodo sentinella

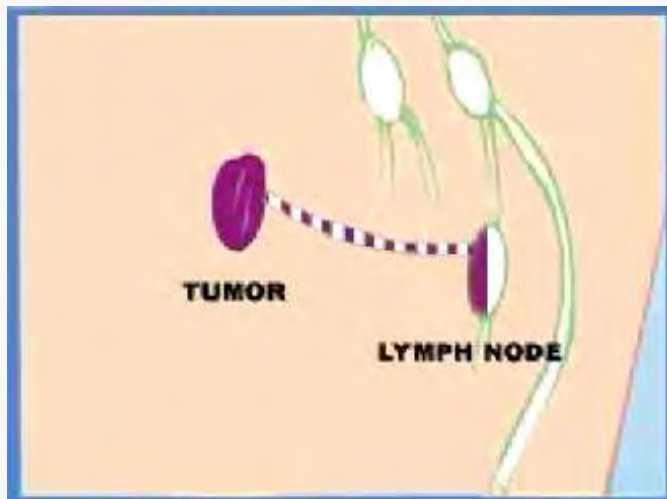

"Il primo possibile sito di metastasi dall'area di drenaggio linfatico della lesione primaria¹"

- Il coinvolgimento “tumorale” del linfonodo sentinella predice la diffusione metastatica del tumore agli altri linfonodi del bacino linfatico: tutti i linfonodi del bacino linfatico sono “sani” se il Linfonodo sentinella è “sano”.

La Biopsia e l'esame istologico del Linfonodo Sentinella permettono di evitare la dissezione ascellare senza rinunciare all'informazione sullo stato dei linfonodi ascellari.

LN sentinella

Punto di inoculo

Altro LN

SPECT/CT - Studio Linfonodo Sentinella

Tecnica

• Impiego della sonda

- Durante l'intervento chirurgico si utilizza una sonda per rilevare la radiazione gamma. La sonda viene passata molto lentamente e perpendicolare ai linfonodi del cavo ascellare per valutare il punto di maggiore emissione del segnale

PET :Tomografia ad Emissione di Positroni

metodica non invasiva
di imaging funzionale

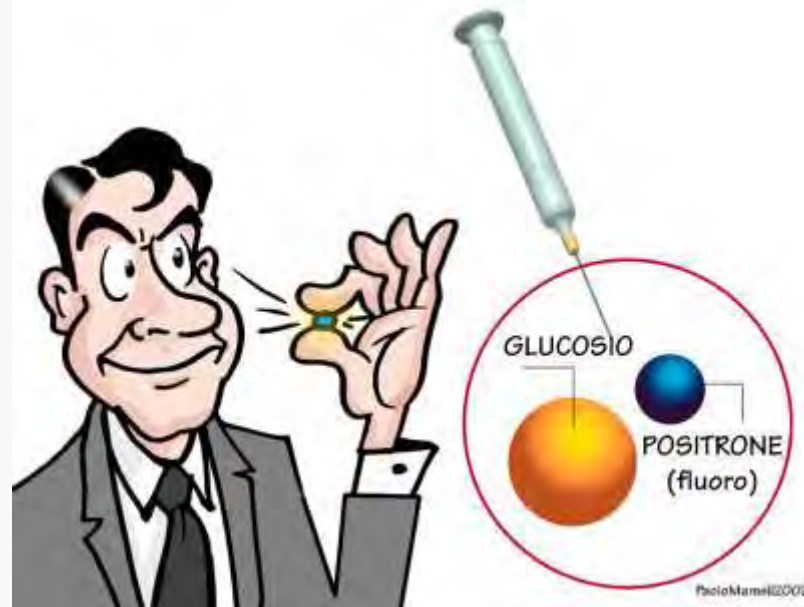

basata sull'impiego di traccianti radioattivi
che, inglobati in specifici complessi molecolari,
vengono somministrati al paziente in esame

Radiofarmaci

Glucosio

-  Carbonio
-  Ossigeno
-  Fluoro-18
-  Idrogeno

^{18}F -fluorodesossiglucosio

[18F]-FDG Il radiofarmaco principe

- Il radiofarmaco più utilizzato in Medicina Nucleare PET (95% degli esami è il 18F-FDG)
- Il 18F-FDG è un analogo del glucosio a cui è stato sostituito un gruppo ossidrilico (- OH) con il fluoro radioattivo
- E' un tracciante del metabolismo glucidico.

Radiofarmaci

"cellule colonizzatrici"

PaoloMamei2002

PaoloMamei2002

PaoloMamei2002

**L'accumulo di FDG nel tumore
E' STRETTAMENTE CORRELATO
al numero di cellule vitali ed
all'attività metabolica**

L' FDG iniettato al paziente si comporta come il glucosio e si accumula maggiormente in sedi ove la glicolisi è attivata in misura abnorme rispetto al consueto metabolismo aerobico, cosa che avviene in varie condizioni patologiche, come ad esempio nel contesto di tumori primitivi e di loro metastasi.

Una serie di rivelatori disposti a corona intorno al paziente, è in grado di registrare questi impatti catturando i fotoni opposti emessi durante le annichilazioni e trasformandoli in segnali elettrici.

- Un calcolatore riceve queste informazioni e calcola la posizione dell'impatto. Con questi dati ricostruisce poi delle immagini in due o tre dimensioni della zona analizzata
- I raggi gamma, di energia pari a 0.511 MeV, essendo in grado di fuoriuscire dal corpo del paziente, possono essere facilmente rivelati.

Il Metabolismo dei glucidi

- I glucidi vengono metabolizzati dalle cellule (cioè convertiti in energia) attraverso una serie di reazioni chimiche cicliche. La Glicolisi, Il ciclo di Krebs, La catena di trasporto degli elettroni
- Queste reazioni avvengono all'interno di ogni cellula del nostro corpo ma in alcuni tessuti (o per ragioni fisiologiche o a causa di malattia) la richiesta di energia è molto maggiore.

• **Cervello** **Cuore** **Tessuti Neoplastici**

- In queste cellule il fabbisogno e consumo di zuccheri risulta maggiorato rispetto alla norma

Il Metabolismo dei glucidi: Glucosio e FDG a confronto

- **L' FDG segue il metabolismo dei glucidi, inizia la glicolisi ma non è riconosciuto dal secondo enzima del ciclo (isomerasi) e rimane bloccato nelle cellule.**
- **In particolare le cellule neoplastiche hanno una intensa attività glicolitica e quindi accumulano maggiori quantità di farmaco.**

"Metabolic trapping" del FDG

Vascular

Analogo del Glucosio

Cancer Cell

angiogenesis, bFGF, PDGF-BB, EGFR

Rimane intrappolato nei tessuti tumorali con attiva glicolisi

Imaging metabolico ed oncologia

Le cellule tumorali presentano caratteristiche alterazioni a livello genetico, a cui corrispondono modificazioni del comportamento metabolico

**L'accumulo di FDG nel tumore
E' STRETTAMENTE CORRELATO**

**al numero di
cellule vitali ed all'incremento dell'attività
metabolica glicolitica tumorale**

Standardized Uptake Value (SUV)

- Parametro semiquantitativo che normalizza la quantità di FDG in una ROI in rapporto all'attività iniettata ed al peso del paziente, corretta per il decadimento

$$\text{SUV} = \frac{\text{Attività ROI (mCi/ml)}}{\text{Dose iniettata (mCi) / Peso pz. (gr)}}$$

- Può orientare la diagnosi differenziale tra una lesione benigna ed una neoplastica.
- Utile per valutare la risposta al trattamento.

SUV 6.7

PET/TC

PET Scans Have Limited Use in Some Situations

Normal retention in:

- **brain**
- **heart**
- **bowel**
- **kidneys**
- **bladder**

Infection can show increased FDG uptake.

A physician needs to interpret PET in the context of all the clinical information

NORMAL FDG-PET

**NORMAL FDG UPTAKE
IN THE HEART,
KIDNEYS, BLADDER**

Science For A Better Life

Medical Use of Radium-223 Chloride

Advisory Committee on the Medical Uses of Isotopes

- **Product name** Radium-223 chloride solution for injection
- **Interim Tradename** Alpharadin
- **Chemical name** Radium-223 chloride ($^{223}\text{RaCl}_2$)
- **Proposed Indication** Treatment of castration resistant (hormone refractory) prostate cancer patients with bone metastases

FDA-Approved Bone-Targeting Radionuclides for the Treatment of Bone Metastases

FDA Approval	Bone Agent	Indication
March 2013 ¹	Radium-223	Treatment of patients with castration-resistant prostate cancer, symptomatic bone metastases, and no known visceral metastatic disease
March 1997 ²	Samarium-153 lexidronam	Relief of pain in patients with confirmed osteoblastic metastatic bone lesions that enhance on radionuclide bone scan
June 1993 ³	Strontium-89	Relief of bone pain in patients with painful skeletal metastases

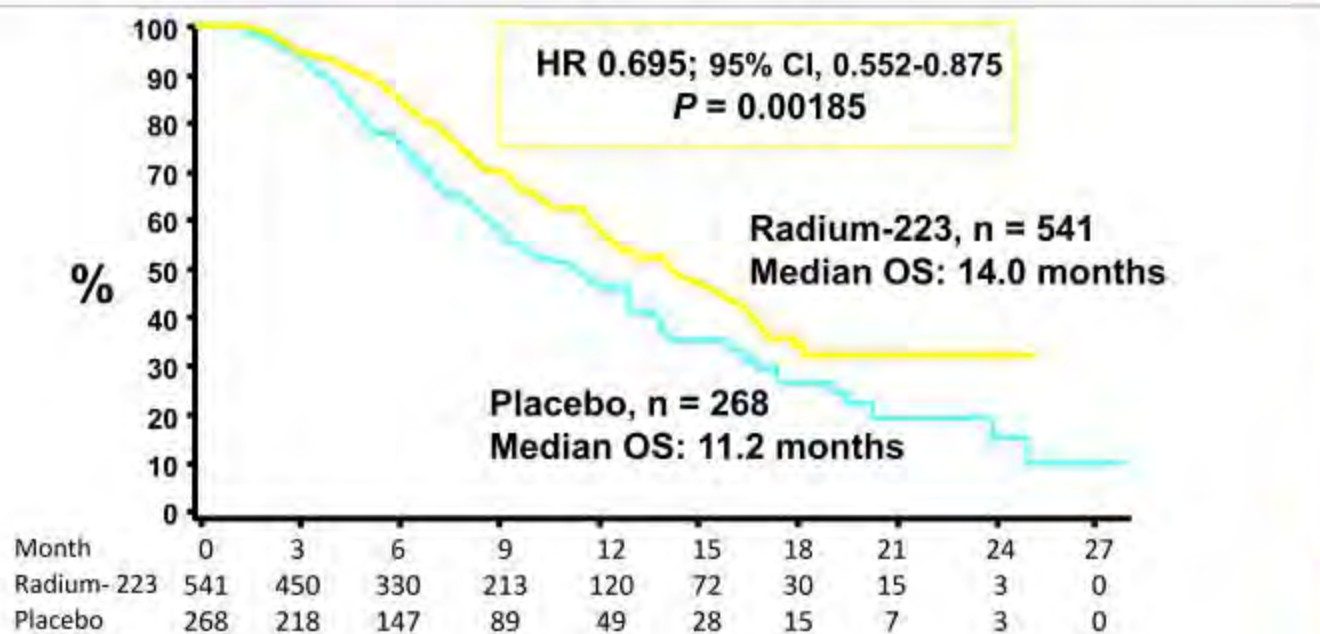

Radium-223 Targets Bone Metastases

- Radium-223 acts as a calcium mimetic
- Naturally targets new bone growth in and around bone metastases
